Virtual Room Emulator is a VST reverb plug-in for native PC platforms. Used to create psycho-acoustic models in the DSP environment. It simulates the reverberation of a sound in a rectangular type room, allowing separate control of the room's width, depth and height. It also allows you to control the distance between the listener and the sound positioned in that virtual room. The Virtual Room Emulator section offers control over the size, width, and damping factor of the room by way of three linkable sliders. Produces a natural sounding room reverberation effect that gives you true room perception, from small rooms to large concert halls. Small rooms have a high percentage of early reflections (the first feedback from the closest objects) that can give more body to tracks. It is also good with acoustic guitars and voices. Larger rooms are better with wind instruments, synthesizer pads or strings. Virtual Room Emulator can also produce ambient mixtures with other effects, including multiple rooms and sidechain effects. Supports input/output levels up to 128db and has an impressive sound quality. Great with vocal tracks and bass guitar. Virtual Room Emulator is perfect for home recording, sound design, composing, arrangement and production. Virtual Room Emulator is intended to provide sound designers with a robust, easy to use interface for creating their own room reverberation effects using high quality reverb algorithms. It is designed for sound designers and producers who want to get more out of their DAW. Virtual Room Emulator is 100% plug-in and requires no DSP programming or electronic engineering knowledge. Simply use the presets or your own tracks to create your own custom reverb sounds. Virtual Room Emulator has several useful features and options to support your workflow. Unique Sliders: Distance: Use the slider to control the distance between the listener and the sound you have placed in the room. Wideness: Use the slider to adjust the room width. This allows you to simulate different sized rooms from a small closet to a large concert hall. Damping: Use the slider to adjust the room damping factor. This will change the overall sound quality of the room. Try experimenting with different damping values to get the perfect room sound for your mix. Vocal Room Emulator Features: Use the slider to increase or decrease the level of the vocal. Audition vocal quality: Use the slider to change the nature of the sound, from a natural
