You are able to easily restructure fields, foreign keys, indexes, constraints and triggers without losing any data. Simply point the application to the Data tab and quickly perform any action you want. When you launch the application for the first time, it will create a default alias for the database you have selected, but you can change it according to your preferences. Then, you can easily open an existing database or create a new one by navigating to the File menu. After choosing the database you are interested in, you are able to view all the tables in the left tree panel and edit them by running complex SQL scripts such as Delete, Update, Insert, Create or Alter Table.
