Once you have the download, open the file and follow the on-screen instructions. Once the installation is complete, you need to crack Adobe Photoshop. Forget the $4 billion (to Adobe alone) that was lost on the failed launch of Photoshop Elements 9. Forget the fact that Elements 9 has been on sale for months for $9. That is also a lot for the average consumer. Let's just be honest. The average consumer never launches software like Photoshop Elements. They need software that gives them core functionality needed to advance their workflow from start to finish. I guess we have the opposite of the "what's good for the goose is good for the gander" equation. Early vision for Lightroom 5.0 was to bring a lot of functionality and functions to a single OS X application. Unfortunately due to time constraints and other circumstances, it was not to be. With Lightroom 5.0 coming out, I had to learn how to work in LR5 without totally resorting to use of Photoshop. When I open a file in the imported section or double-click on a file in the Catalog, I get a new LR window. If I want to go back to the previous window, I have to close the new one and reopen it. If I want to switch to Photoshop to make an adjustment, since there is no Open in Photoshop option, I have to switch between the two windows. This is just one of the issues that I have to note. Other issues include: no features to sort/specify photos beyond the original three, no LUT support; no live histogram support; and no recommendations. DPI, Dots per Inch (), are used to describe the resolution of a device's display. In computer imaging, these sorts of things are used to describe the resolution of a digital image. The original DPI setting of a device's display was 72dots per inch – until the advent of LCD displays. LCD screens were a huge innovation since they're such a lightweight and inexpensive type of display compared to CRT displays and the colors resolved on them were much more vivid. Today, the most common display resolution for computing devices is 96dots per inch and for the past several years, that's become the standard DPI setting. 96dots per inch generally equates to a screen size of 13 inches for a 1366 by 768 display.
