Lightroom is basically for purists, and in some senses that may be a good thing. Those who simply want to view, have edited and share pictures should just use the desktop version. Presets, the library of finished images, are used as startup images, so you get almost instantly the finished look for each image. That approach may have added some value for some types of images, but Lightroom has trouble with some types, and more importantly, hasn't accepted the shift to the cloud. The Lumetri color panel lets you share your color palette with friends or collaborate on a project by giving you real-time visual feedback. It also comes with significant automatic support for color sequencing and change. While Photoshop still has great support for color workflow, the issue is that you have to use them. That's why you'll often look to the other programs of the Adobe family for these types of controls. As with all tools, you have to learn it to use it, and basically just stick to your smart object selection if you want to edit one. Normally, you'd need to use a second option to isolate a particular layer, like using the Stroke Selection mode. With layered selections (such as the ones you use for video), you can add folders and remove them at will, and generally, you can add and subtract an unlimited number of layers at any time. It's probably the most flexible tool in the package. In addition to the new elements, there are also a few other updates to the user interface: the Appearance tab is now broken down into two separate tabs—Color and Effects. Style is now called Content-Aware Style, since it will now analyze your images and adjust other styles on top of them. And there are tool names, which is great if you are not familiar with Photoshop.
